MAMA AI COOLMA

The mSearch product enables semantic search in large databases of text documents.

mSearch is an artificial intelligence product of MAMA that searches for information based on the relevance match between the query and the search text. The search is therefore not only based on the occurrences of words, but on their meanings and relationships. It can get a relevant answer even if it does not contain any keyword entered in the query. The system can search in text documents and across languages. It is possible to ask a question in a foreign language, while the answer can be found in the Czech collection of documents and vice versa.

Unique selling points:

- Ensuring high relevance of responses.
- Quickly search large databases of documents.
- Language-independent search.
- The opportunity to work on a global scale.
- Integrability of mSearch product into corporate applications.
