MOJE SRDCE

Automated diagnostics for patients with cardiovascular disease, providing disease information, targeted treatment recommendations and regimen measures.

The aim is to improve preventive care and user motivation through individualized education. All this while minimizing the involvement of the specialist physician and maximizing the use of the system's automated function. A system of preset links between health information is used for automation. This system and its associated level of automation is a competitive advantage over other telemedicine platforms. Machine learning is then used to further refine the links between the data. The effect on users' health will be verified by a randomized clinical trial.

Unique selling points:

- Using AI to connect patient data analysis.
- Ensuring efficiency of care through automated diagnostics.
- Recommendations for health professionals.
- The ability to use individualized content for patients to maximize prevention.
