MOLEMAN

We change the logic of the Combined Nomenclature search from the need to know the logic of the TARIC classification system to an innovative way through product knowledge.

The Combined Nomenclature (CN) is a system of classification of goods used to determine customs tariffs and trade statistics between countries. The CN is complex and there are many categories and sub-categories of goods that have specific characteristics and features. The correct CN designation is important for determining the correct customs duty and other tax and trade measures applicable to the goods. The APLICON system is an innovative way of searching CN. It uses product knowledge to help users find the correct CN code for their goods. This is unlike other systems that require users to know the logic of the CN system. The APLICON system is more user-friendly and easier to use and is also more accurate.

Unique selling points:

- Speeding up the process
- Refining the selection
- Simplify the process
